Agentic Finance: start here

The challenge, what to build, and every link from Ripple's workshop (5 November 2026, led by Maxime Dienger of Ripple and Pamphile Roy of The Aha Company).

Workshop recording
Watch the Ripple Agentic Finance Workshop on Zoom (1 hour, no passcode)

Workshop slides
XRPL-Workshop-Slides-Ripple.pdf, the other file in this BuilderBase batch

Rules, dates, submission and judging
Everything about the hackathon itself is in the Node Engine Participant Hub (Google Doc).

Start in five steps

1. **Watch the workshop** (recording, 1 hour) or skim the slides in this batch.
2. **Read the challenge and the MVP checklist** on this page. They say what Ripple wants to see.
3. **Get test funds:** test XRP from the XRP faucets and test RLUSD from tryrlusd.com.
4. **Send your first transaction** with xrpl.js or xrpl-py. The full 15-line example is on slide 15.
5. **Give your agent a wallet with limits** (Privy agent wallets or the Open Wallet Standard), then follow the XRPL AI starter kit.

The challenge: Would your CFO sign off?

Moving money across African borders still means multi-day delays, wide FX margins and limited access to dollars. Stablecoins like RLUSD, settled on the XRP Ledger, are changing those rails across the continent. The next shift is who operates them. AI agents can already pay, trade, invest and buy services on their own. What they lack is the trust of the people whose money they would move.

An importer in Cape Town loses days and margin on every supplier payment to Lagos. A remittance company keeps cash prefunded in ten corridors, most of it sitting idle. A stokvel treasurer tracks twenty members' contributions on WhatsApp. An insurer takes weeks to pay a farmer after a drought. Agents could run all of it. But every business, savings group and cooperative has someone who answers for the money, its CFO. They won't let an agent in until four questions are answered: what is the agent allowed to do, who can it pay, how do I stop it, and how do I prove what it did and why.

Your challenge: build a product that CFO would sign off on. Not a prompt, not a chatbot, but a working solution where an AI agent moves money on behalf of a business, a group or a household, and the XRP Ledger enforces the rules it plays by.

What we mean by a solution. The agent is one piece. Whoever adopts your product also needs a way to set up the agent's wallet and keys, define its mandate (limits, approved counterparties, budgets), see what it is doing, and stop it when needed. Your solution must start from a real pain point, for a specific customer you can name, and come with a go-to-market strategy: who uses it, why they would switch from what they use today, and how you reach them.

What your MVP must include

- At least one transaction on XRPL Testnet or Devnet executed autonomously by an agent.
- Limits enforced somewhere the agent doesn't control: on the ledger, by an independent service, or by a funded Payment Channel it cannot overdraw.
- A way for a human to set or change those limits, outside the agent.
- A demo where the agent gets blocked beats one that only shows the happy path. An agent that recommends a move for a human to approve, or a chatbot that explains a balance, does not clear the bar.

Product ideas to get you started

- **Autopilot payables for cross-border SMEs.** An agent pays approved suppliers in RLUSD or local currency through the DEX within FX limits, buys FX quotes and KYB checks per call, and routes large payments to Escrow or a second signer.
- **Liquidity manager for remittance companies.** An agent rebalances prefunded liquidity across corridors, parks the excess in a Single Asset Vault, and draws on the Lending Protocol when a corridor runs dry, all within a treasury policy the finance team controls.
- **Smarter remittances for families.** An agent receives remittances in RLUSD, converts only what the family needs into local currency at the best rate, pays school fees or bills directly to approved recipients and puts the rest of the money to work.
- **Parametric payouts for insurers and cooperatives.** An agent watches a paid data feed, checks that beneficiaries hold the right Credential, and releases payouts from a vault or Escrow within a fixed budget.
- **Agent-ready financial services.** A data or compliance provider (FX rates, KYB, credit scoring) that charges agents per call or per session through x402 or MPP, only serves agents whose operator holds a Credential, and gets paid for valid results only.
- **Embedded credit for merchants.** A lending product where an agent underwrites from on-chain payment history and manages loans through the Lending Protocol, funded by depositors in a vault, within risk limits set by the lender.

Building blocks to combine

- **Agent wallets and keys:** Open Wallet Standard, Privy Agent Wallets, multi-signing, revocable regular keys.
- **Mandate enforcement:** Credentials (XLS-70), Permissioned Domains, Deposit Authorization, Escrow.
- **Money movement:** RLUSD, native DEX and AMM, Checks, Payment Channels.
- **Yield and credit:** Single Asset Vaults (XLS-65), Lending Protocol (XLS-66).
- **Tokenization:** Multi-Purpose Tokens (XLS-33) for invoices, receivables or group shares.
- **Paid services:** x402 (t54 facilitator), MPP charges and sessions.
- The strongest projects combine several of these into one product. A demo of a single primitive won't score well on viability.

What Ripple looks for in this track

- **Viability:** does it solve a real pain point, for a clear customer, with a credible go-to-market?
- **Autonomy:** does the agent really act on its own?
- **Enforcement:** are its limits enforced where it can't bypass them?
- **Use of XRPL:** how well do you combine XRPL primitives and ecosystem tools?
- **Originality:** does it target a customer or a problem other teams overlooked?
- This list comes from Ripple's challenge statement. The W3Node scoring rubric and rules are in the Participant Hub.

Prize

- $2,500 for the track.
- The winning team is fast-tracked for an interview for UDAX Cape Town, Ripple's accelerator run with UCT. In the interview Ripple looks for founder potential, motivation and the ability to keep building.

Good to know from the workshop

- Build on Testnet for features already live on mainnet. Use Devnet for features still open for voting, such as the Lending Protocol and Single Asset Vault.
- The XRPL EVM Sidechain is out of scope for this track.
- An account needs 1 XRP to activate, plus 0.2 XRP for each object it owns. Plan for this in your onboarding flow.
- Starting a new token? Use MPTs. Use IOUs when you need the DEX or AMM today.
- Never commit or share a wallet seed. Check that your AI coding tools do not write it to a public repository.
